

TAG lifecycle chart vs transmission cycle

Calculation example for ITEMS IR's lifecycle

For an emission cycle of 1,3 second, the red line crosses the horizontal line for 10 months.

BUT you have to multiply by 10 this first value.

In fact, for an emission cycle of 1,3 second, the COIN HC (and also the ITEMS ID) will have an **indicative autonomy of 100 months, or 8 years and 3 months!**

*For ITEMS IR multiply by 10
